Business Intelligence Overview Report

Global Superstore Sales Analysis

Prepared by: **Kukoyi Zainab Omotola**

AnalystLab Africa Data Analytics Internship | Week 2 | October 2026

1. What is Business Intelligence?

Business Intelligence (BI) is the process of collecting, cleaning, analyzing and presenting business data so that people can make better decisions. Raw data on its own, such as thousands of sales records, tells a manager very little. BI tools such as Microsoft Power BI turn that data into measures, charts and reports that show what is happening in the business and why. The flow is simple: data is gathered from its source, prepared and organized, analyzed, and finally presented in a form that decision-makers can understand and act on.

2. Why Organizations Use Dashboards

A dashboard brings the most important performance indicators together on a single, interactive screen. Organizations use dashboards because they replace slow, manual reports with a clear view of the business. Managers can track sales, profit and customer behavior in one place and drill into a region, segment or product with a single click. This saves time, reduces errors from copying figures between spreadsheets, and ensures everyone is looking at the same numbers.

3. How Dashboards Improve Decision-Making

- Faster decisions: key figures are visible immediately instead of waiting for a monthly report.
- Clearer insight: visuals make trends, comparisons and unusual results easy to spot.
- Evidence-based choices: decisions rest on data instead of assumptions or guesswork.
- Early problem detection: falling margins or loss-making products can be caught before they become serious.
- Shared understanding: every department works from one consistent version of the facts.

For example, a retailer that sees on a dashboard that one product line sells well but loses money can adjust its pricing or discounts quickly, rather than discovering the problem at the end of the year.

4. Business Objective of the Selected Dataset

The Global Superstore dataset contains the order records of a global retailer, covering sales, profit, discounts, customers, products and markets over several years. The business objective is to help senior management monitor overall performance and identify where the company earns or loses money, so that it can improve profitability and plan growth. The dataset at a glance:

Dataset	Summary
Source	Global Superstore dataset (Kaggle, Option 2)
Size	51,290 order lines across 24 columns; 25,035 unique orders
Period	2011 to 2014
Coverage	7 markets (APAC, EU, US, LATAM, EMEA, Africa, Canada), 3 customer segments, 3 product categories
Key measures	Sales, Profit, Quantity, Discount, Shipping Cost

The dashboard built from this data will answer the following business questions:

- What is the overall sales performance of the company?
- Which regions generate the highest sales and profit?
- Which customer segments contribute the most revenue?

- Which product categories and individual products perform best?
- What trends can be observed over time, and what should management do next?
